## 1 Constant Parameters

## 2 Default Values for Parameters

# Outline

1 Constant Parameters

2 Default Values for Parameters

# Constant Parameters

- A **constant parameter** is a function parameter that the function is not permitted to change.
- To make a parameter constant, use the keyword **const** in the formal parameter list.
- Both value and reference parameters may be designated constant.
- If a function receives a constant parameter, it may not pass it to another function as a non-constant parameter.

# Examples of Constant Parameters

- Example

- LetterCountFunc.cpp

# Constant Parameters

- A Dilemma:

# Constant Parameters

- A Dilemma:
  - Value parameters “waste time” making the copies.

# Constant Parameters

- A Dilemma:

- Value parameters “waste time” making the copies.
- Yet, reference parameters are not protected against change.

# Constant Parameters

- A Dilemma:
  - Value parameters “waste time” making the copies.
  - Yet, reference parameters are not protected against change.
  - So, what do we do if we want to pass a large parameter (large object) efficiently *and* protect it against change by the function?

# Constant Parameters

- A Dilemma:
  - Value parameters “waste time” making the copies.
  - Yet, reference parameters are not protected against change.
  - So, what do we do if we want to pass a large parameter (large object) efficiently *and* protect it against change by the function?
- The Solution:
  - Make the parameter a **constant reference** parameter.
  - The object is protected (by **const**).
  - Only its address is passed (by reference).

# Outline

1 Constant Parameters

2 Default Values for Parameters

# Default Values for Parameters

- A function parameter may be given a **default value**.
- If a default value is specified in the formal parameter list and the object is not included in the actual parameter list, then the formal parameter takes on the default value.
- Default values are specified only in the function prototype, not in the function definition.

# Examples of Default Parameter Values

- Examples

- PercentScore.cpp
- GetWordFunc2.cpp

# Assignment

## Assignment

- Read Section 6.12.
