# Computer Organization Secs 1.1-1.2 

 Lecture 2Robb T. Koether<br>Hampden-Sydney College

Wed, Aug 28, 2019
(1) The Main Components
(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Outline

(1) The Main Components
(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## The Main Components

- The Central Processing Unit (CPU)
- Memory (RAM)
- Secondary storage devices (e.g., hard drive, flash drive)
- Input devices (e.g., keyboard)
- Output devices (e.g., monitor)

## The CPU

- The central processing unit (CPU).
- The register file.
- The arithmetic and logic unit (ALU).
- The branch unit.
- The memory read/write unit.
- The control unit.

## The CPU

- The CPU:
- Performs arithmetic.
- Addition, subtraction, logical operations, etc.
- Makes logical decisions.
- Branch if two values are equal, etc.
- Loads data from memory to registers.
- Stores data from registers to memory.

## Memory

- Levels of memory.
- Registers (in the CPU).
- Level 1 Cache (L1)
- Holds commonly used data.
- " $10 \%$ of the data is used $90 \%$ of the time."
- Level 2 Cache (L2)
- Holds less commonly used data.
- Main Memory
- Holds data that are "seldom" used.

## Outline

## (1) The Main Components

(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Input and Output

- The keyboard is standard input, referred to as cin in C++ programs.
- The monitor is standard output, referred to as cout in C++ programs.
- There is also standard error, referred to as cerr in C++ programs.

## Input and Output

- The keyboard is standard input, referred to as cin in C++ programs.
- The monitor is standard output, referred to as cout in C++ programs.
- There is also standard error, referred to as cerr in C++ programs.
- In C, they were called stdin, stdout, and stderr.

## Outline

## (1) The Main Components

(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Representing Data

- How can a machine "store" a number?
- We design a machine that can be put into different "states."
- Each state represents a value.
- For example, the values 0 through 9 may be represented by 10 different states.

## Representation of Data

- How could we represent the values 0 through 99 ?

## Representation of Data

- How could we represent the values 0 through 99 ?
- Build a machine with 100 states.

## Representation of Data

- How could we represent the values 0 through 99?
- Build a machine with 100 states.
- Or, build two machines with 10 states each.
- One machine represents the 1's digit.
- The other machine represents the 10 's digit.
- With six 10 -state machines, we could represent values from 0 to 999999.

## Binary Representation of Data

- In computers, it is more efficient to use only two states.
- A light: on/off
- A switch: open/closed
- Voltage: high/low
- Therefore, numbers will be stored in binary (base 2) rather than decimal.

## Outline

## (1) The Main Components

(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Binary Representation of Data

- With 1 bit, we can represent 2 different values, namely 0 and 1.

## Binary Representation of Data

- With 1 bit, we can represent 2 different values, namely 0 and 1.
- With 2 bits, we can represent 4 different values, namely 0 through 3.

| Pattern | Value |
| :---: | :---: |
| 00 | 0 |
| 01 | 1 |
| 10 | 2 |
| 11 | 3 |

## Binary Representation of Data

- With 3 bits, we can represent 8 values, namely 0 through 7 .

| Pattern | Value |
| :---: | :---: |
| 000 | 0 |
| 001 | 1 |
| 010 | 2 |
| 011 | 3 |
| 100 | 4 |
| 101 | 5 |
| 110 | 6 |
| 111 | 7 |

## Binary Representation of Data

- With 4 bits, we can represent 16 values, namely 0 through 15.

| Pattern | Value |
| :---: | ---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |

| Pattern | Value |
| :---: | ---: |
| 1000 | 8 |
| 1001 | 9 |
| 1010 | 10 |
| 1011 | 11 |
| 1100 | 12 |
| 1101 | 13 |
| 1110 | 14 |
| 1111 | 15 |

## Binary Representation of Data

- With 4 bits, we can represent 16 values, namely 0 through 15.

| Pattern | Value |
| :---: | ---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |

| Pattern | Value |
| :---: | ---: |
| 1000 | 8 |
| 1001 | 9 |
| 1010 | 10 |
| 1011 | 11 |
| 1100 | 12 |
| 1101 | 13 |
| 1110 | 14 |
| 1111 | 15 |

But what about negative numbers?

## Negative Numbers

- We "reinterpret" 8 through 15 as -8 through -1 .

| Pattern | Value |
| :---: | ---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |

| Pattern | Value |
| :---: | ---: |
| 1000 | -8 |
| 1001 | -7 |
| 1010 | -6 |
| 1011 | -5 |
| 1100 | -4 |
| 1101 | -3 |
| 1110 | -2 |
| 1111 | -1 |

This is called two's complement notation.

## Fixed-Length Binary Numbers

- In general, $n$ bits can represent any of $2^{n}$ different values.
- We can represent positive (unsigned) numbers from 0 to $2^{n}-1$.
- 4 bits represent values from 0 to 15.
- 8 bits represent values from 0 to 255 .
- 16 bits represent values from 0 to 65535 .
- 32 bits represent values from 0 to 4294967296.
- Or we can represent signed numbers from $-2^{n-1}$ to $2^{n-1}-1$.
- 8 bits represent values -128 to +127 .
- 16 bits represent values -32768 to +32767 .
- 32 bits represent values -2147483648 to +2147483647 .
- 64 bits represent values -9223372036854775808 to +9223372036854775807 . ( $\pm 9$ quintillion)

## Binary Number System

- In the binary number system, each position in the number represents a power of 2.
- Example: 101011 represents

$$
\left(1 \times 2^{5}\right)+\left(0 \times 2^{4}\right)+\left(1 \times 2^{3}\right)+\left(0 \times 2^{2}\right)+\left(1 \times 2^{1}\right)+\left(1 \times 2^{0}\right)
$$

which equals $32+8+2+1=43$.

## The Structure of Memory

- 1 bit = 1 binary digit (0 or 1 ).
- 1 half-byte (nibble) $=4$ bits.
- 1 byte $=2$ nibbles $=8$ bits.
- 1 half-word $=2$ bytes $=16$ bits.
- 1 word = 4 bytes = 32 bits (standard on 32-bit processor).
- 1 long word $=8$ bytes $=64$ bits (standard on 64-bit processor).
- 1 kilobyte $(\mathrm{Kb})=1024$ bytes $=2^{10}$ bytes.
- 1 megabyte $(\mathrm{Mb})=1024 \mathrm{~Kb}=2^{20}$ bytes.
- 1 gigabyte $(\mathrm{Gb})=1024 \mathrm{Mb}=2^{30}$ bytes.
- 1 terabyte $(\mathrm{Tb})=1024 \mathrm{~Gb}=2^{40}$ bytes.

## Outline

## (1) The Main Components

(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Hexadecimal Numbers

- For convenience, we often display values in hexadecimal (base 16).
- The hexadecimal system has 16 digits with values 0 through 15.

| Hex | Binary | Value |
| :---: | :---: | :---: |
| 0 | 0000 | 0 |
| 1 | 0001 | 1 |
| 2 | 0010 | 2 |
| 3 | 0011 | 3 |
| 4 | 0100 | 4 |
| 5 | 0101 | 5 |
| 6 | 0110 | 6 |
| 7 | 0111 | 7 |

| Hex | Binary | Value |
| :---: | :---: | :---: |
| 8 | 1000 | 8 |
| 9 | 1001 | 9 |
| A | 1010 | 10 |
| B | 1011 | 11 |
| C | 1100 | 12 |
| D | 1101 | 13 |
| E | 1110 | 14 |
| F | 1111 | 15 |

## Examples of Hexadecimal Numbers

$$
\begin{aligned}
4 \mathrm{~A}_{16} & =(4 \times 16)+10=74, \\
\mathrm{FF}_{16} & =(15 \times 16)+15=255, \\
123_{16} & =\left(1 \times 16^{2}\right)+(2 \times 16)+3=292, \\
\mathrm{FACE}_{16} & =\left(15 \times 16^{3}\right)+\left(10 \times 16^{2}\right)+(12 \times 16)+14 \\
& =61440+2560+192+14 \\
& =64206 .
\end{aligned}
$$

## Hexadecimal Numbers

- Hexadecimal numbers are convenient because
- They are compact.
- There is a very simple relation between them and binary numbers, namely, One hexadecimal digit represents a 4-digit binary number (values 0-15), or half a byte.
- They are much easier to read and transcribe than binary numbers. That is, consider copying 11111111111111100000000000000000 vs. copying FFFE0000.
- Example: HexNumbers.cpp

## Outline

## (1) The Main Components

(2) Input and Output
(3) Storing Numbers

- Binary Numbers
- Hexadecimal Numbers
- Converting Between Binary and Hexadecimal

## Conversion from Hexadecimal to Binary

- Convert 2B6F to binary
- Write each hex digit as a 4-bit binary number.

| Binary | Hex |
| :---: | :---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |

| Binary | Hex |
| :---: | :---: |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |

| Binary | Hex |
| :---: | :---: |
| 1000 | 8 |
| 1001 | 9 |
| 1010 | A |
| 1011 | B |

| Binary | Hex |
| :---: | :---: |
| 1100 | C |
| 1101 | D |
| 1110 | E |
| 1111 | F |

- $2=0010$
- $\mathrm{B}=1011$
- $6=0110$
- $F=1111$
- Write the 4 -bit numbers together as a single binary number

## 0010101101101111

## Conversion from Binary to Hexadecimal

- Convert 1001101011101011 to hexadecimal.
- Break it up into groups of 4 bits (starting on the right). 1001101011101011
- Write each block of 4 bits as a hex digit.

| Binary | Hex |
| :---: | :---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |

| Binary | Hex |
| :---: | :---: |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |

| Binary | Hex |
| :---: | :---: |
| 1000 | 8 |
| 1001 | 9 |
| 1010 | A |
| 1011 | B |

| Binary | Hex |
| :---: | :---: |
| 1100 | C |
| 1101 | D |
| 1110 | E |
| 1111 | F |

$$
9 \text { A E B }
$$

- Write the hex digits as a single hex number. 9AEB
