- 1 Input and Output
- 2 Compound Assignments
- 3 Increment and Decrement
- 4 Assignment

Outline

- 1 Input and Output
- 2 Compound Assignments
- 3 Increment and Decrement
- 4 Assignment

Input and Output Streams

- Input and output use streams.
- A **stream** is a mechanism that allows us to pass information back and forth between our program and the input and output devices.
- Think of a stream as a sequence of characters sent by one device and received by the other.
- Input streams are objects of the `istream` class.
- Output streams are objects of the `ostream` class.

Buffered Input and Output

- An **input buffer** is a portion of memory where the data in the input stream (characters typed at the keyboard) are stored until the program is ready to read them.
- An **output buffer** is a portion of memory where the data output by the program are stored until the program is ready to display them.
- **Unbuffered output** moves directly to the output device, character by character.

Standard Input

- **Standard input** refers to the keyboard.
- Standard input is an `istream` object named `cin`.
- Standard input is **buffered**.
- The buffer contains the sequence of characters typed at the keyboard.
- `cin` analyzes the characters in the buffer to determine the value of the input, according to the data type being read.

Input and Output

- A fundamental difference between input and output, other than the obvious difference, is
 - On output, the computer knows the data type *and* the value of the object.
 - On input, it knows only the data type; it must figure out the value from a stream of keyboard characters as they are entered.
- Thus, we have a few rules governing input.

The Extraction (Input) Operator

The Input Operator

```
int a;  
float b;  
char c;  
string str;  
cin>> a >> b >> c >> str;
```

- The operator `>>` is the extraction, or input, operator.
- Values may be extracted from an input stream to named objects only.
- Run the demo program `InputTest.cpp`.

Standard Output

- **Standard output** refers to the text window displayed on the monitor.
- Standard output is an `ostream` object named `cout`.
- Standard output is buffered.
- `cout` converts values into their character representations and stores the characters in the buffer.
- At appropriate times, the characters in the buffer are displayed at the monitor (usually immediately).

The Insertion (Output) Operator

The Output Operator

```
int a = 123;  
int b = 456;  
cout << "The sum of " << a << " and " << b  
      << " is " << a + b << endl;
```

- The operator << is the insertion, or output, operator.
- Values of constants, named objects, and expressions may be inserted into an output stream.

Outline

- 1 Input and Output
- 2 Compound Assignments**
- 3 Increment and Decrement
- 4 Assignment

Compound Assignment Operators

- The operator `+=` means “add to.”
- The statement

`x += y;`

is equivalent to

`x = x + y;`

Compound Assignment Operators

Compound Assignment Operators

```
x += y;      // "Add to x" - Same as x = x + y
x -= y;      // "Subtract from x" - Same as x = x - y
x *= y;      // "Multiply x by" - Same as x = x * y
x /= y;      // "Divide x by" - Same as x = x / y
x %= y;      // "Mod x by" - Same as x = x % y
```

- Common compound-assignment operators:

Examples: Compound Assignment

Find the Value

```
int a = 12;
```

```
a += 8;
```

```
a -= 5;
```

```
a *= 4;
```

```
a /= 5;
```

```
a %= 8;
```

- What is the value of `a`?

Outline

- 1 Input and Output
- 2 Compound Assignments
- 3 Increment and Decrement**
- 4 Assignment

Increment and Decrement Operators

- To **increment** is to add 1.
- To **decrement** is to subtract 1.
- The increment operator is `++`.
- The decrement operator is `--`.
- These operators may be applied only to named objects.

Pre- and Post-Increment

- To **pre-increment** an object means to increment it **before** using it in the expression.
 - Write the operator *before* the object: `++x`
- To **post-increment** an object means to increment it **after** using it in the expression.
 - Write the operator *after* the object: `x++`
- The same goes for decrement.

Pre- and Post-Increment

Pre- and Post-Increment

```
x = 3;  
x++;           // This is fine  
y = ++x;       // OK, but not recommended  
z = x++;       // OK, but not recommended  
w = (++(++x))++; // Never do this  
u = x+++x+++x; // Or this
```

- What are the values of `y`, `z`, `w`, and `u`?
- My advice is, never use `++` or `--` in conjunction with any other operator.
- Run the program `IncrementTest.cpp`.
