Introduction

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- We wish to compare two or more populations by observing the values of a qualitative variable for each of them.
- For example, in the populations of Democrats, Republicans, and Independents, do they exhibit a different distribution of opinions about Mayor Wilder?
- In this case, we are asking whether the populations are **homogeneous**.

Introduction

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Or we could say that we wish to investigate the relationship between two or more qualitative variables for a single population.
- For example, given the population of all adults, is one's opinion of Mayor Wilder independent of one's political affiliation?
- In this case, we are asking whether the variables are **independent**.
- The two questions are the same. The same test will answer both of them.

Homogeneous Populations

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

Definition (Homogeneous)

Two populations are called **homogeneous** if they exhibit the same distributions over the same categories.

Examples

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- If two colleges' student bodies are each 55% female and 45% male, then the populations are homogeneous.
- If a teacher teaches two sections of Statistics using two different teaching methods and the two sections have the same grade distributions, then they are homogeneous.

Example

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Suppose a teacher teaches two sections of Statistics and uses two different teaching methods.
- At the end of the semester, he gives both sections the same final exam and he compares the grade distributions.
- He wants to know if the differences that he observes are significant.

Example

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Does there appear to be a difference?
- Or are the two populations homogeneous?

	A	B	C	D	F
Method I	5	7	36	17	7
Method II	7	11	18	7	5

The Test of Homogeneity

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- The null hypothesis is that the populations are homogeneous.
- The alternative hypothesis is that the populations are not homogeneous.
 - H_0 : The populations are homogeneous.
 - H_1 : The populations are not homogeneous.

Independence

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

Definition (Independent)

Two variables are **independent** if the value of one has no bearing (no predictive value) on the other.

Mendel's Experiments

Tests of
Homogeneity
and
Independence

Robb T.
Koether

Introduction

Homogeneous
Populations

Independent
Variables

Mendel's
Experiments

The Test of
Homogeneity
or
Independence

The Expected
Counts

Summary

- In Mendel's experiments, Mendel observed
 - 75% yellow seeds, 25% green seeds.
 - 75% smooth seeds, 25% wrinkled seeds.
- Because color and texture were independent, he also observed
 - $9/16$ yellow and smooth
 - $3/16$ yellow and wrinkled
 - $3/16$ green and smooth
 - $1/16$ green and wrinkled

Mendel's Experiments

Homogeneous
Populations

Independent
Variables

Mendel's
Experiments

The Test of
Homogeneity
or
Independence

The Expected
Counts

Summary

Article

City Hall turmoil: Richmond Times-Dispatch poll

- Observe each person's opinion and political affiliation.
- Do the two variables appear to be independent?

	Excellent	Good	Fair	Poor	Not Sure
Dem	38	70	59	86	16
Rep	21	31	33	23	7
Ind	13	23	31	41	7

The Test of Independence

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- The null hypothesis is that the variables are independent.
- The alternative hypothesis is that the variables are not independent.
 - H_0 : The variables are independent.
 - H_1 : The variables are not independent.

An Example

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- We will work the example of the two teaching methods.

	A	B	C	D	F
Method I	5	7	36	17	7
Method II	7	11	18	7	5

The Test Statistic

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- The test statistic is the chi-square statistic, computed as

$$\chi^2 = \sum_{\text{all cells}} \frac{(O - E)^2}{E}.$$

- The question now is, how do we compute the expected counts?

Expected Counts

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Under the assumption of homogeneity or independence (H_0), the rows should exhibit the same proportions.
- We can get the best estimate of those proportions by **pooling** the rows.
- That is, find the column totals then compute the column proportions from them.

Row and Column Proportions

Expected Counts

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Now apply the appropriate row and column proportions to each cell to get the expected count.
- For example, in the upper-left cell, according to the row and column proportions, it should contain

60% of 10% of 120.

- That is, the expected count is

$$0.60 \times 0.10 \times 120 = 7.2.$$

Expected Counts

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- This is the same as

$$\left(\frac{72}{120}\right) \times \left(\frac{12}{120}\right) \times 120 = \frac{72 \times 12}{120} = 7.2.$$

- Therefore, the quick formula is

$$\text{Expected Count} = \frac{\text{Row Total} \times \text{Column Total}}{\text{Grand Total}}.$$

Expected Counts

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- Apply that formula to each cell to find the expected counts and add them to the table.

	A	B	C	D	F
Method I	5 (7.2)	7 (10.8)	36 (32.4)	17 (14.4)	7 (7.2)
Method II	7 (4.8)	11 (7.2)	18 (21.6)	7 (9.6)	5 (4.8)

Variables

Mendel's
Experiments

The Test of
Homogeneity
or
Independence

The Expected
Counts

Summary

- Now compute χ^2 in the usual way.

$$\begin{aligned}\chi^2 &= \frac{(5 - 7.2)^2}{7.2} + \frac{(7 - 10.8)^2}{10.8} + \frac{(36 - 32.4)^2}{32.4} \\ &\quad + \frac{(17 - 14.4)^2}{14.4} + \frac{(7 - 7.2)^2}{7.2} + \frac{(7 - 4.8)^2}{4.8} \\ &\quad + \frac{(11 - 7.2)^2}{7.2} + \frac{(18 - 21.6)^2}{21.6} + \frac{(7 - 9.6)^2}{9.6} \\ &\quad + \frac{(5 - 4.8)^2}{4.8} \\ &= 7.2106.\end{aligned}$$

Degrees of Freedom

Tests of Homogeneity and Independence

Robb T. Koether

Introduction

Homogeneous Populations

Independent Variables

Mendel's Experiments

The Test of Homogeneity or Independence

The Expected Counts

Summary

- The number of degrees of freedom is

$$df = (\text{No. of rows} - 1) \times (\text{No. of cols} - 1).$$

- In our example, $df = (2 - 1) \times (5 - 1) = 4$.
- To find the p -value, calculate

$$\chi^2 = \chi^2_{\text{cdf}}(7.2106, E99, 4) = 0.1252.$$

- At the 5% level of significance, the differences are not statistically significant.

Summary

Tests of
Homogeneity
and
Independence

Robb T.
Koether

Introduction

Homogeneous
Populations

Independent
Variables

Mendel's
Experiments

The Test of
Homogeneity
or
Independence

The Expected
Counts

Summary

Summary

- Homogeneity of populations and independence of variables are two different ways of looking at the same thing.
- The χ^2 test is used to settle the question of homogeneity or independence.
- The test statistic is the same as it was for the goodness-of-fit test:

$$\chi^2 = \sum_{\text{all cells}} \frac{(O - E)^2}{E}.$$

Homogeneity
and
Independence

Robb T.
Koether

Introduction

Homogeneous
Populations

Independent
Variables

Mendel's
Experiments

The Test of
Homogeneity
or
Independence

The Expected
Counts

Summary

Summary

- The main difference is how the expected counts are found:

$$\text{Expected count} = \frac{(\text{Row total}) \times (\text{Column total})}{\text{Grand total}}.$$
