# “Big-O” Notation: $O(f)$

## Definition (Big-O)

- Let  $f : \mathbb{R} \rightarrow \mathbb{R}$  be a function.
- A function  $g : \mathbb{R} \rightarrow \mathbb{R}$  is  $O(f)$  (“big-O of  $f$ ”) if there exist constants  $c \in \mathbb{R}$ ,  $n_0 \in \mathbb{N}$  such that

$$g(n) \leq cf(n)$$

for all  $n \geq n_0$ .

- In other words,  $g(n)$  is bounded above by a constant multiple of  $f(n)$  from some point on.

# Examples

## Example (Proving and Disproving Big-O)

- Show that  $5n + 8$  is  $O(n)$ .
- Show that  $n^2 + 10n + 5$  is  $O(n^2)$ .
- Show that  $n^2 + 10n + 5$  is *not*  $O(n)$ .

# Examples

$$f(n) = n$$

# Examples

$$f(n) = n \text{ and } g(n) = 5n + 8$$

# Examples

$f(n) = n$  and  $g(n) = 5n + 8$  and  $6f(n) = 6n$

# Examples

$$f(n) = n^2$$

# Examples

$$f(n) = n^2 \text{ and } g(n) = n^2 + 10n + 5$$

# Examples

$$f(n) = n^2 \text{ and } g(n) = n^2 + 10n + 5 \text{ and } 2f(n) = 2n^2$$

# Examples

$100f(n) = 100n$  and  $g(n) = n^2 + 10n + 5$ , over  $0 \leq n \leq 10$

# Examples

$100f(n) = 100n$  and  $g(n) = n^2 + 10n + 5$ , over  $0 \leq n \leq 50$

# Examples

$100f(n) = 100n$  and  $g(n) = n^2 + 10n + 5$ , over  $0 \leq n \leq 100$

# Growth Rates

- If  $g$  is  $O(f)$ , then the growth rate of  $g(n)$  is no greater than the growth rate of  $f(n)$ .
- If  $g$  is  $O(f)$  and  $f$  is  $O(g)$ , then  $f(n)$  and  $g(n)$  have the same growth rate.
- In this case, we say that  $g$  is  $\Theta(f)$  (big-theta).

# Example

## Example (Equal Growth Rates)

- Show that  $5n + 8$  is  $\Theta(n)$ .

# Equal Growth Rates

## Theorem (Equal Growth Rates)

- $an + b$  is  $\Theta(n)$  for all  $a$  and  $b$ , with  $a > 0$ .

# Equal Growth Rates

## Theorem (Equal Growth Rates)

- $an + b$  is  $\Theta(n)$  for all  $a$  and  $b$ , with  $a > 0$ .
- $an^2 + bn + c$  is  $\Theta(n^2)$  for all  $a$ ,  $b$ , and  $c$ , with  $a > 0$ .

# Equal Growth Rates

## Theorem (Equal Growth Rates)

- $an + b$  is  $\Theta(n)$  for all  $a$  and  $b$ , with  $a > 0$ .
- $an^2 + bn + c$  is  $\Theta(n^2)$  for all  $a$ ,  $b$ , and  $c$ , with  $a > 0$ .
- $an^3 + bn^2 + cn + d$  is  $\Theta(n^3)$  for all  $a$ ,  $b$ ,  $c$ , and  $d$ , with  $a > 0$ .

# Equal Growth Rates

## Theorem (Equal Growth Rates)

- $an + b$  is  $\Theta(n)$  for all  $a$  and  $b$ , with  $a > 0$ .
- $an^2 + bn + c$  is  $\Theta(n^2)$  for all  $a$ ,  $b$ , and  $c$ , with  $a > 0$ .
- $an^3 + bn^2 + cn + d$  is  $\Theta(n^3)$  for all  $a$ ,  $b$ ,  $c$ , and  $d$ , with  $a > 0$ .
- And so on.

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	
$\Theta(\log_2 n)$	
$\Theta(n)$	
$\Theta(n \log_2 n)$	
$\Theta(n^2)$	
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	
$\Theta(n)$	
$\Theta(n \log_2 n)$	
$\Theta(n^2)$	
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	
$\Theta(n \log_2 n)$	
$\Theta(n^2)$	
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	Sequential search
$\Theta(n \log_2 n)$	
$\Theta(n^2)$	
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	Sequential search
$\Theta(n \log_2 n)$	Merge sort
$\Theta(n^2)$	
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	Sequential search
$\Theta(n \log_2 n)$	Merge sort
$\Theta(n^2)$	Selection sort
$\Theta(2^n)$	
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	Sequential search
$\Theta(n \log_2 n)$	Merge sort
$\Theta(n^2)$	Selection sort
$\Theta(2^n)$	Factor an integer
$\Theta(n!)$	

# Common Growth Rates

Growth Rate	Example
$\Theta(1)$	Access an array element
$\Theta(\log_2 n)$	Binary search
$\Theta(n)$	Sequential search
$\Theta(n \log_2 n)$	Merge sort
$\Theta(n^2)$	Selection sort
$\Theta(2^n)$	Factor an integer
$\Theta(n!)$	Traveling salesman problem

# Outline

- 1 “Big-O” Notation:  $O(f)$
- 2 Estimating Run Times**
- 3 Comparison of Growth Rates

  - Basic Member Functions
  - Search and Sort Functions
- 5 Assignment

# Estimating Run Times

- Suppose the run time of a program is  $\Theta(f)$ , for a specific function  $f(n)$ .
- Then the run time  $t(n)$  satisfies

$$c_1 f(n) \leq t(n) \leq c_2 f(n)$$

for some real numbers  $c_1$  and  $c_2$ .

- We typically assume that  $t(n) = cf(n)$  for some real number  $c$ .

# Estimating Run Times

- Suppose program runs in  $t_0$  seconds when the input size is  $n_0$ .  
Then

$$c = \frac{t_0}{f(n_0)}.$$

- Thus,

$$t(n) = t_0 \left( \frac{f(n)}{f(n_0)} \right).$$

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is  $\Theta(n^2)$ .

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is  $\Theta(n^2)$ .
- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is  $\Theta(n^2)$ .
- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .
- Then

$$t(n) = 5 \left( \frac{n^2}{100^2} \right) \mu\text{s}.$$

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is  $\Theta(n^2)$ .
- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .

- Then

$$t(n) = 5 \left( \frac{n^2}{100^2} \right) \mu\text{s}.$$

- Thus, if the input size is 1000, then the run time is

$$t(1000) = 5 \left( \frac{1000^2}{100^2} \right) = 500 \mu\text{s}.$$

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is

$$\Theta(n \log n).$$

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is

$$\Theta(n \log n).$$

- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is

$$\Theta(n \log n).$$

- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .
- Then

$$t(n) = 5 \left( \frac{n \log n}{100 \log 100} \right) \mu\text{s}.$$

# Example

## Example (Estimating Run Times)

- Suppose the run time of a program is

$$\Theta(n \log n).$$

- Suppose further that the program runs in  $t_0 = 5 \mu\text{s}$  when the input size is  $n_0 = 100$ .
- Then

$$t(n) = 5 \left( \frac{n \log n}{100 \log 100} \right) \mu\text{s}.$$

- Thus, if the input size is 1000, then the run time is

$$t(n) = 5 \left( \frac{1000 \log 1000}{100 \log 100} \right) = 75 \mu\text{s}.$$

# Comparison of Growth Rates

- Consider programs with run times that are  $\Theta(1)$ ,  $\Theta(\log n)$ ,  $\Theta(n)$ ,  $\Theta(n \log n)$ , and  $\Theta(n^2)$ .
- Assume that each program runs in  $1 \mu\text{s}$  when the input size is 100.
- Calculate the run times for input sizes  $10^2$ ,  $10^3$ ,  $10^4$ ,  $10^5$ ,  $10^6$ ,  $10^7$ , and  $10^8$ .

# Examples

$$g(n) = n! \text{ vs. } 1000f(n) = 1000 \cdot 2^n, 0 \leq n \leq 5$$

# Examples

$$g(n) = n! \text{ vs. } 1000f(n) = 1000 \cdot 2^n, 0 \leq n \leq 8$$

# Examples

$$g(n) = n! \text{ vs. } 1000f(n) = 1000 \cdot 2^n, 0 \leq n \leq 12$$

# Example

## Example (Traveling Salesman)

- `TravelingSalesman.cpp`.

# Feasible vs. Infeasible

## Definition (Feasible)

An algorithm is considered to be **feasible** if it is  $O(n^k)$  for some integer  $k$ . Otherwise, it is considered to be **infeasible**.

- Of course, nearly every algorithm is “feasible” for small input sizes.
- It is feasible to factor small integers ( $< 50$  digits).
- It is infeasible to factor large integers ( $> 200$  digits).

# Outline

- 1 “Big-O” Notation:  $O(f)$
- 2 Estimating Run Times
