# The Membership Problem for CFGs

## Definition (The Membership Problem for CFGs)

Given a context-free language  $L$  and a word  $w$ , is  $w$  in  $L(G)$ ?

- We may assume that  $G$  is in Chomsky Normal Form.
- Let  $n$  be the length of the word  $w$ .

# The Membership Problem for CFGs

- An unsophisticated, brute-force algorithm will examine every possible derivation of length  $2n - 1$  (actually  $n - 1$ ).
- If none of these produces  $w$ , then  $w \notin L(G)$ .
- There problem is, the number of such derivations may grow exponentially in  $n$ . (Why?)
- We need a better algorithm.

## Definition (To parse)

Given a grammar  $G$  and a string  $W$ , to **parse**  $w$  is to find a derivation of  $w$  in  $G$ .

- There are many different parsing algorithms for context-free grammars.
- As usual, the more powerful parsing algorithms are more complex.
- We will examine a relatively simple algorithm developed by Cocke, Younger, and Kasami, known as the **CYK algorithm**, which runs in polynomial time.

# Outline

1 The Membership Problem for CFGs

**2 The CYK Parsing Algorithm**

3 Assignment

# The CYK Parsing Algorithm

- The strategy of the CYK algorithm is to begin with all one-symbol substrings of  $w$  that are derivable from  $G$ .
- These come directly from the rules of the form  $A \rightarrow a$ .
- Then proceed inductively.

# The CYK Parsing Algorithm

- Let  $w = a_1 a_2 a_3 \cdots a_n$ .
- Let  $w_{ij} = a_i \cdots a_j$ , for all  $1 \leq i \leq j \leq n$ .
- Define sets

$$V_{ij} = \{A \in V \mid A \xrightarrow{*} w_{ij}\}.$$

- For example,
  - $V_{11} = \{A \in V \mid A \xrightarrow{*} a_1\}$ .
  - $V_{35} = \{A \in V \mid A \xrightarrow{*} a_3 a_4 a_5\}$ .
  - $V_{1n} = \{A \in V \mid A \xrightarrow{*} w\}$ .

# The CYK Parsing Algorithm

## The Basic Step

- Initialize each  $V_{ij}$  to the set of all variables  $A$  for which there is a rule  $A \rightarrow a_j$ .

# The CYK Parsing Algorithm

## The Inductive Step

- For  $i < j$ , compute

$$V_{ij} = \bigcup_{i \leq k < j} \{A \in V \mid A \rightarrow BC \text{ and } B \in V_{ik} \text{ and } C \in V_{k+1,j}\}.$$

- That is,  $B \xRightarrow{*} a_i \cdots a_k$  and  $C \xRightarrow{*} a_{k+1} \cdots a_j$ , so

$$A \Rightarrow BC \xRightarrow{*} a_i \cdots a_j.$$

# Example

## Example (The CYK Parsing Algorithm)

- Let the grammar  $G$  be

$$S \rightarrow SAS \mid \mathbf{bAa}$$

$$A \rightarrow \mathbf{aS} \mid \mathbf{Sb} \mid \mathbf{ab} \mid \lambda$$

- Let  $w = \mathbf{ababaa}$ .
- Is  $w \in L(G)$ ?

# Example

## Example (The CYK Parsing Algorithm)

- The grammar converted to CNF is

$$S \rightarrow SD \mid CE \mid SS \mid CB$$

$$A \rightarrow BS \mid SC \mid BC$$

$$B \rightarrow \mathbf{a}$$

$$C \rightarrow \mathbf{b}$$

$$D \rightarrow AS$$

$$E \rightarrow AB$$

# The CYK Parsing Algorithm

## Example (The CYK Parsing Algorithm)

- The CYK algorithm is much easier to perform if we use an  $n \times n$  table.
- The entry in row  $i$ , column  $j$  is the set  $V_{ij}$ .
- We begin by initializing the diagonal elements  $(i, i)$  and then proceed inductively to the right.

# Example

## Example (The CYK Parsing Algorithm)

- Because  $S \in V_{1,7}$ , **babaaba**  $\in L(G)$

# Example

## Example (The CYK Parsing Algorithm)

- Let the grammar  $G$  be

$$E \rightarrow E + E \mid E * E \mid (E) \mid \mathbf{a} \mid \mathbf{b}$$

- Use the CYK algorithm to show that  $\mathbf{a(+b * c)} \notin L(G)$ .
