## 1 List Processing

- Find the Largest Element
- Verify the Order
- Delete an Element
- Insert an Element
- Search for an Element
- Sort

## 2 Examples

## 3 Assignment

## 1 List Processing

- Find the Largest Element
- Verify the Order
- Delete an Element
- Insert an Element
- Search for an Element
- Sort

## 2 Examples

## 3 Assignment

# List Processing

- There is a variety of things we might want to do with a list.
  - Find the largest or smallest element.
  - Verify that the elements are in order.
  - Delete an element from the list.
  - Insert an element into an ordered list.
  - Search the list for a specified value.
  - Sort the list, i.e., arrange, the elements into increasing or decreasing order.

# Outline

- 1 List Processing
  - Find the Largest Element
  - Verify the Order
  - Delete an Element
  - Insert an Element
  - Search for an Element
  - Sort

2 Examples

3 Assignment

# Largest Element

## Find the Largest Element

- Find the largest element in an array.
- The function should return
  - The largest value.
  - Or, the index of the largest value.
- Which is the better choice?
- At least one, but preferably all, of the order operators  $<$ ,  $>$ ,  $<=$ ,  $>=$  must be defined on the data type.
- What if the array is empty?

# Find the Maximum in an Array

## Find the Maximum in an Array

- The Problem
  - Find the largest element in an array.
- The Algorithm
  - Initialize `max_so_far` to the first element.
  - Make 1 pass down the list, starting with the second element.
  - Compare `max_so_far` to each element from positions 1 to  $n - 1$ .
  - Replace `max_so_far` with the larger value whenever one is found.

# Outline

- 1 List Processing
  - Find the Largest Element
  - **Verify the Order**
  - Delete an Element
  - Insert an Element
  - Search for an Element
  - Sort

2 Examples

3 Assignment

# Verify Order

## Verify the Order

- Verify that the elements of the array are in order (ascending or descending).
- The function should return **true** or **false**, indicating whether the elements are in order.
- At least one of the order operators  $<$ ,  $>$ ,  $<=$ ,  $>=$  must be defined on the data type.

# Verify that an Array is in Order

## Verify that an Array is in Order

- The Problem
  - Verify that the elements of an array are in ascending order.
- The Algorithm
  - Make 1 pass down the list.
  - Compare each member, except the last, to its immediate successor.
  - If a pair is found out of order, return **false** (immediately).
  - If no pair is found out of order, return **true**.

# Outline

## 1 List Processing

- Find the Largest Element
- Verify the Order
- **Delete an Element**
- Insert an Element
- Search for an Element
- Sort

## 2 Examples

## 3 Assignment

## Delete an Element

- Delete an element from an array.
- The function should return **true** or **false**, indicating whether the value was successfully deleted, or it could be a **void** function.
  - What if the item was not found?
  - What if the array is empty?
  - What if the value occurs more than once in the array?

# Delete an Element from an Array

## Delete an Element from an Array

- The Problem
  - Delete an value from an unordered array.
- The Algorithm
  - Start at the beginning of the list (position 0).
  - Compare the value to each element (indexes 0 through  $n - 1$ ).
  - If they do not match, then move to the next element.
  - If they match, then continue down the list, copying each subsequent element to the previous position to plug up the hole left by the deletion.

# Delete an Element from an Array

## Delete an Element from an Array

- If the array is ordered, then the search may stop as soon as the value to be deleted is smaller than the element to which it is compared.

# Outline

## 1 List Processing

- Find the Largest Element
- Verify the Order
- Delete an Element
- **Insert an Element**
- Search for an Element
- Sort

## 2 Examples

## 3 Assignment

## Insert an Element

- Insert an element into an ordered array.
- The function should return **true** or **false**, indicating whether the value was successfully inserted, or it could be a **void** function.
  - What if the value is already in the list?
  - What if the array is full?
- At least one of the order operators  $<$ ,  $>$ ,  $<=$ ,  $>=$  must be defined on the data type.

# Insert an Element into an Array

## Insert an Element into an Array

- The Problem
  - Insert a value into its proper place in an ordered array.
- The Algorithm
  - Start at the end (position  $n - 1$ ).
  - Moving towards the beginning, compare the value to be inserted to each element in the list.
  - If the value is smaller, shift the element up one position in the array.
  - If the value is larger, put it in the previous position.

# Insert an Element into an Array

## Insert an Element into an Array

- If the list is unordered, then the value may be inserted in the last open position (position  $n$ ).

# Outline

- 1 List Processing
  - Find the Largest Element
  - Verify the Order
  - Delete an Element
  - Insert an Element
  - **Search for an Element**
  - Sort

2 Examples

3 Assignment

## Search an Array

- Search a list for a value.
- The function should return
  - **true** or **false**, indicating *whether* the value was found.
  - Or, the index of the position *where* the value was found.
  - Or, both.
- The list may be sorted or unsorted.

# Outline

- 1 List Processing
  - Find the Largest Element
  - Verify the Order
  - Delete an Element
  - Insert an Element
  - Search for an Element
  - **Sort**

2 Examples

3 Assignment

## Sort an Array

- Arrange the elements in order.
- The function should be `void`.
- At least one of the order operators `<`, `>`, `<=`, `>=` must be defined on the data type.

# Outline

- 1 List Processing
  - Find the Largest Element
  - Verify the Order
  - Delete an Element
  - Insert an Element
  - Search for an Element
  - Sort

- 2 Examples

- 3 Assignment

# Example of Array Processing

- Examples

- `AverageAge.cpp`
- `Date.cpp`

# Outline

- 1 List Processing
  - Find the Largest Element
  - Verify the Order
  - Delete an Element
  - Insert an Element
  - Search for an Element
  - Sort

- 2 Examples

- 3 Assignment

# Assignment

## Assignment

- Read Sections 8.5, 8.6.
