- 5 Assignment

Vertices

- Objects consist basically of a set of **vertices** that define points in the plane (2D) or in space (3D).
- The vertices are grouped to create triangles and triangles are grouped to make more complex surfaces (meshes).
- For example, a 3D box might consist of 6 rectangles, i.e., 12 triangles.
- To make a sphere, we would typically use about 6400 triangles (80 points around the equator, 40 points from pole to pole, each region split into 2 triangles.)

Vertices

- Vertices are described by specifying their **attributes**.
 - Position
 - Color
 - Normal vector (orientation)
 - Texture coordinates
- These attributes are fed into the **graphics pipeline**.
- Each stage of the pipeline performs an operation on the object.

Outline

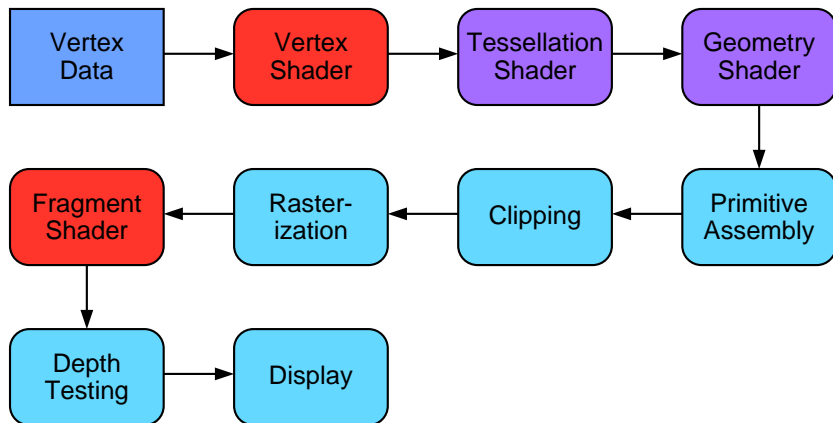

- 1 Vertices
- 2 The Graphics Pipeline**
- 3 The Vertex Shader
- 4 The Fragment Shader
- 5 Assignment

Stages of the Pipeline

- The stages of the pipeline:
 - Vertex shader
 - Tessellation shader
 - Geometry shader
 - Primitive assembly
 - Clipping
 - Rasterization
 - Fragment shader
 - Per-fragment processing

- The programmer is responsible for the shaders
 - Vertex shader (mandatory)
 - Tessellation shader (optional)
 - Geometry shader (optional)
 - Fragment shader (mandatory)
- The other stages are “fixed.” The programmer has no control over them.

The Graphics Pipeline

Outline

- 1 Vertices
- 2 The Graphics Pipeline
- 3 The Vertex Shader**
- 4 The Fragment Shader
- 5 Assignment

The Vertex Shader

- At a minimum, the vertex shader assigns a value to the built-in shader variable `gl_Position`.
- If that is all that the shader does, then it is called a **pass-through shader**.
- Vertex shaders typically do much more than that.

A Pass-Through Vertex Shader

A Pass-Through Vertex Shader

```
#version 450 core

layout (location = 0) in vec3 vPosition;

void main()
{
    gl_Position = vec4(vPosition, 1.0f);
}
```

A Pass-Through Vertex Shader

A Pass-Through Vertex Shader (with Color)

```
#version 450 core

layout (location = 0) in vec3 vPosition;
layout (location = 1) in vec3 vColor;

out vec4 color;

void main()
{
    gl_Position = vec4(vPosition, 1.0f);
    color = vec4(vColor, 1.0f);
}
```

Outline

- 1 Vertices
- 2 The Graphics Pipeline
- 3 The Vertex Shader
- 4 The Fragment Shader**
- 5 Assignment

The Fragment Shader

- A **fragment** is typically a pixel, although it may be a part of a pixel.
- At a minimum, the fragment shader outputs the color of the pixel.
- The name of the output variable does not matter because all fragment shaders output only the color.
- A **pass-through shader** receives the color from the fragment shader and outputs it unchanged.
- Fragment shaders typically do much more than that.

A Pass-Through Fragment Shader

A Pass-Through Fragment Shader (with Fixed Color)

```
#version 450 core

out vec4 fragColor;

void main()
{
    fragColor = vec4(1.0f, 0.0f, 0.0f, 1.0f);
}
```

A Pass-Through Fragment Shader

A Pass-Through Fragment Shader (with Color Input)

```
#version 450 core

in vec4 color;
out vec4 fragColor;

void main()
{
    fragColor = color;
}
```
